Howard Hughes – The Road to Hearing Loss, Part I

November 14, 2017. Reprinted with permission from hearinghealthmatters.org

Forty-two years after the [first US oil well was drilled in Titusville, Pennsylvania in 1859](#), a wildcatter known as [Captain Anthony Lucas](#) was convinced there was oil beneath the salt domes near Beaumont, Texas. His 1901 discovery of oil at [Spindletop](#), near Beaumont, Texas, marked the birth of the modern petroleum industry. News of the new “Oil Boom” drew the attention of the son of a Lancaster, Missouri Judge, [Howard Robards Hughes Sr.](#) While his brothers and sisters were becoming opera stars and novelists, Howard Sr. dropped out of Harvard and Law School at Iowa State to become a self taught attorney in his father’s law practice. The study and practice of Law was too confining for young Hughes, Sr. who said, “I soon found the law a too-exacting mistress for a man of my talent, and I quit her between dark and dawn, and have never since been back. I decided to search for my fortune under the surface of the earth.”

**Sharp-Hughes Tool Company
Houston, Tx, c. 1909**

Hughes, Sr. first went to the Dallas area to experiment with the oil business and later to East Texas where he would try his luck as a wildcatter. In that first decade of the century drilling was an arduous task, as drilling into hard rock formations rocks took the drills forever to penetrate. After becoming frustrated by these difficulties of drilling with the [standard “fishtail” drill bit](#), Hughes, Sr. devised a [superior two-cone bit](#), which made drilling easier and virtually revolutionized the oil industry. Hughes patented the technology in 1909 and, with partner [Walter Sharp](#), formed the [Houston-based Sharp-Hughes Tool](#)

[Company](#) to manufacture the bit. After Sharp died in 1912, Hughes, Sr. bought his interest in the company. When he in turn passed away in 1924, [Howard Robards Hughes, Jr.](#), an only child whose mother had died two years earlier, inherited the thriving company and became a millionaire. Hughes, Jr., then only 18-years-old dropped out of [Rice University](#), let others manage the oil-tool business and set out for Hollywood in 1925.

**The Oil Boom Begins
Spindletop, Texas - January 1901**

This begins what Nix (2015) describes as a lifetime journey for one of the world’s wealthiest men who became a Hollywood filmmaker, record-setting aviator and business mogul who once owned a big chunk of Las Vegas and controlled a major U.S. airline (TWA) and other interesting ventures

such as the [Spruce Goose](#) and looking for sunken Soviet submarines off the US coast. Later in life, however, he became an eccentric recluse who feared germs and shunned personal hygiene. *And, as with many men of his generation, he embarked on a road to severe hearing loss.*

While the road to hearing loss probably began with his initial flying lessons as a teenager, the real damage most likely occurred during the shooting of the movie “Hell’s Angels“. At the time, the most expensive movie ever made at 3.95 million (57,000,000 in 2016 dollars) and after a couple of unsuccessful box office showings, Hell’s Angels needed to be a success. This was Hughes’s first attempt at movie directing after two directors quit because of his rants of “not enough realism”. He and the other pilots were exposed to huge amounts of machine gun and explosion noise during the dogfighting scenes. While references do not indicate the medical specifics, it is known that as a pilot in the movie, Hughes crashed one of these WWI vintage planes and suffered a skull fracture. Click on the picture of the WWI fighters and the movie poster for how real this footage was presented. These days these movie shots would be done with models in a laboratory, not with real planes.

This was only the beginning of the noise exposure for Hughes. After the movies, major business interests lay in aviation, airlines, and the aerospace and defense industries. Learning to fly as a teenager, Hughes along with many of his generation was a lifelong aircraft enthusiast and pilot. He

set many world records and commissioned the construction of custom aircraft for himself while heading [Hughes Aircraft](#) at the [airport in Glendale, CA](#). While there is no doubt that his noise exposure piloting the aircraft of this era greatly contributed to his hearing loss, further damage to his hearing would also have been the 3 other airplane crashes after the one while filming *Hell's Angels*. Even His girlfriend, Katherine Hepburn (Kate Blanchet in the movie *Aviator*) knew of the hearing loss, click on the [movie clip](#) to hear her say it! These crashes would be while setting the 1935 air speed record in the [Hughes Racer](#), at [Lake Mead in 1943 where the propeller snapped killing two others](#), and his Beverly Hills [near fatal crash of the Hughes XF-11 in 1946](#) that probably contributed substantially to his hearing loss. He was expected to die from the multiple fractures and burns over 78% of his body, leading to the liberal administration of morphine and the beginning of his lifelong addiction to opiates, particularly Codeine to ease the pain. His physicians would tell us later that he took as many as 20-30 aspirin tablets and 40 codeine tablets a day. These days we know much more about drugs than in 1946. For example, a study described by [Hear-it.org](#) (2009), carried out by Australian researchers found that regular users of codeine risk losing part or even all of their hearing. According to the study, far from all codeine users suffer hearing loss, but this serious side-effect seems to strike randomly, suddenly and permanently. In extreme cases, [use of codeine at recommended doses over 1-4 years can result in total deafness](#) and Hughes used Codeine for 30 years.

Getting the Hearing Aid for Use By Howard Hughes

Later as he aged, Hughes became Obsessive Compulsive (OCD) and therefore was eccentric about many things especially germs being everywhere. According to Bartlett and Steele (1979), the instructions for detailed for removing his hearing aid from the bathroom cabinet. *“Before the hearing aid could be removed its storage place for use staff had to use between six and eight new tissues as a barrier when turning the bathroom door knob, the door is to be left open so there will be no need to touch anything when leaving the bathroom. The same Kleenex may be used to turn*

on the spigots so as to obtain a good force of warm water. This Kleenex is then disposed of. A new set of six to eight Kleenexes were used open the cabinet containing the soap and a fresh bar of soap that has never been opened is used. All Kleenex that has been used to this point is disposed of. The hands are to be washed with extreme care, far more thoroughly than they have been washed before taking great pains that they hands did not touch the bowl, spigots or anything else in the process. Great care should be exercised when setting the soap down on the soap dish or whatever it is set on so that the hands do not come into contact with anything. A new set of 15-20 Kleenexes are now used to turn off the spigots and these Kleenexes are now thrown away. The door to the cabinet is to be opened with a minim of 15 fresh Kleenexes. (Great care must be exercised in the opening and closing of the cabinet doors. They are not to be slammed or swung hastily so as to raise any dust, yet exceeding care is to exercised against letting insects in) Nothing inside the cabinet is to be touched—inside the doors, top of the cabinet the sides—No other objects inside the cabinet are to be touched in any way except the sealed envelope to be removed. The sealed envelope with the hearing aid is to be removed with 15 new Kleenexes if both hands are used that 15 Kleenexes are used for each hand.” Now THATS REAL OCD! No wonder he did not use his hearing aid very often; by the time they were able to get the device ready, the conversation was over!

Howard Hughes: The Road to Hearing Loss, Part II
November 27, 2017. Reprinted with permission from hearinghealthmatters.org

Circa 1974

Circa 1947

In part 1 we discussed the bizarre behavior of one of the richest people in world history, Howard Robards Hughes, Jr.

There are reasonably credible stories that have surfaced about Mr. Hughes suggesting that the person on record as dying as Howard Hughes while descending into Houston April 12, 1976 **may not have actually been him**. It seems that Mr. Hughes was quite prone to using doubles to fool the public, the government, and business associates as to his whereabouts, but we will present that case next week. For the purposes of Part II, let's assume that the person who died in the airplane was actually Mr. Hughes. There are reports (Breo, 1979) of **hearing loss during childhood**, but these could be simply childhood ear infections that would come and go with childhood or real hearing loss from **high fever** or other disorders but there is not much evidence of this is available. His doting mother was known to be concerned about "Sonny" her only child contracting **polio**, a major childhood disease of the time, and was obsessed with "germs" and cleanliness, an issue that was transferred to Howard and haunted him throughout life. From a clinical standpoint, of more concern to his hearing was the substantial exposure to aircraft noise, concussions and skull fractures (depending upon where and how these took place) from airplane crashes, use of **opioids in the form of codeine** and aspirin as well as possible aminoglycoside toxicity in treatment which may have been for the burns he suffered over 78% of his body in the **nearly fatal 1946 crash of his XF-11 plane**.

USAF Museum Photo Archives

Hughes' final physician, Dr. Wilbur Thain, began treating him in 1973 when he was taking 40

tablets of codeine a day and he reduced that to about 5 per day but upped the aspirin 20-30 tablets per day. Medical records and audiometric assessments are, of course are not readily available as Mr. Hughes and his staff worked very hard to keep his private issues, especially health, a secret. Alchenter (2017) among others stated that, “Howard Hughes, probably the richest man ever, inflation adjusted, [at the time of his death] was mostly deaf. He could only hear people if he was talking one on one with them and they were close. This made him shy in groups. It also made him intensely good at focusing on whatever he was interested in with no distractions.” Additionally in most depictions of Mr. Hughes he seems to favor his right ear, both in movies about him and in his congressional testimony. In support of Alchenter’s comments, codeine addiction has been known to cause mental / psychological effects including:

Wilbur Thain, MD
Hughes Physician 1973-1976

- Impaired Cognitive Function
- Disorientation
- Mood Swings and/or Irritability
- Hallucinations
- Depression
- Anxiety

While the issues created by the drugs might explain his eccentric behavior during his last years, adding hearing loss into the equation would contribute to the paranoia, isolation and other concerns effecting his actions during these last years of his life. When asked by Breo (1979) in an interview for People Magazine, if Hughes was an impossible patient, his personal physician in those later years, Dr. Wilbur Thain said, “That’s a masterpiece of understatement. He wanted doctors around, but he didn’t want to see them unless he had to. He would allow no X-rays—I never saw an X-ray of Hughes until after he died—no blood tests, no physical exams. He understood his situation and chose to live the way he lived. Rather than listen to a doctor, he would fall asleep or say he couldn’t hear. He had some hearing loss partially due to his work around aircraft. That’s why he liked to use the telephone: It had an amplifier. He was very alert and well-informed.”

But.....What of the Hearing Loss?

As for the hearing loss, Mr. Hughes had some devastating experiences relative to hearing over his lifetime. While there are no audiograms that are readily available for Mr. Hughes it is possible to predict hearing loss based upon the known noise exposure, injuries and drug ingestion. His noise exposure had to be huge in that he was flying in open cockpit planes for his epic movie and further noise exposure was to other aviation noises which we know are devastating to hearing. Additionally there has to be some ototoxicity with his high consumption of codeine the other drugs, such as aspirin, valium and others. Blakely & Schilling (2008) present that, “Ototoxicity associated with narcotic-acetaminophen combinations is not widely recognized. This can be the cause of severe-to-profound hearing loss that may be overlooked.” When this issue is coupled with the intense noise exposure, it would probably leave the person with a severe to profound hearing loss. Review of his testimony in the late 1940s, as suggested above, indicates that he favored his right ear so probably there was a bit less impairment for the right side. While I have no audiometric evidence to support my estimates, I would suspect that Mr. Hughes’ hearing loss at the time of his death in April 1976 would be similar to the audiogram above or possibly worse. Additionally, this type of hearing impairment is often accompanied by significant tinnitus and Hyperacusis which would have contributed to all of the issues outlined above by Dr. Thain.
